

Collaborate with us

IANT is a service provider for Unified Communications and Voice over IP in Next Generation Networks. IANT develops special and customized communications systems for corporate customers based on open standard software.

The Challenge

IANT is an engineering team located in Wolfenbuttel, Germany, with its roots in research and development in VoIP technologies. IANT needed a solution that would fit their customers telephony needs; a scalable, dependable system suitable for the European market, and expandable for customization.

The Solution

Through the open source sipX software, as well as eZuce's commercial product Uniteme, IANT is able to supply their customers with the scalable systems they need. IANT can easily integrate the software with their customers' existing networks, and even achieve a gradual transition from a traditional PBX system to the eZuce VoIP solution. The API also allows IANT to integrate their own software and applications into the system to tailor it to customers' telephony needs.

The Benefits

- Unified Communications as IT application
- Integration with IT applications: CRM, ERP, etc.
- No vendor lock-in
- Can be virtualized, cloud-ready
- HD audio quality
- Built-in video communication
- FMC - seamless integration of field staff
- VoIP over DECT
- SLAs up to 24/75

Because of the flexibility and scalability that eZuce's VoIP software offers, we are able to offer our customers a telephony solution that cuts down on hardware resources while maintaining reliability. This is why Uniteme has become the backbone of our business.
